2

Properties of addition. Parentheses.

Math 2 Classwork 11

WARM UP

What number am I?

a) When I am taken from 26, the result is 12.

b) When I have 18 added to me, the result is 49.

c) When I am decreased by 60, the result is 17.

Insert the correct number:

a) 3,687 has a _____ in the ten's place

b) 3,687 has a _____ in the thousand's place

c) 3,687 has a _____ in the hundred's place

Homework Review

1. Find a perimeter:

a) The length of a rectangle is 37 cm, and its height is 14 cm. Calculate the perimeter of the rectangle. P =_____

b) The length of a rectangle is 37 cm, which is 14 cm more than its height. Calculate the perimeter of the rectangle. $P = _$

2. A polygonal chain has 3 segments. The length of the first segment is 5 cm, the length of the second segment is 1cm shorter, than the length of the first one and the length of the 3^{rd} segment equals the sum of the 1^{st} and 2^{nd} segments. Finds the total length of the polygonal chain. Draw this chain.

Lesson 11

Properties of addition. Parentheses.

New Material I

Commutative and Associative properties of addition.

Commutative property: When two numbers are added, the sum is always the same regardless of the order of the addends. For example: 3 + 5 = 5 + 3

Associative property: When three or more numbers are added, the sum is always the same regardless of grouping of the addends. For example: (3 + 5) + 1 = 3 + (5 + 1)

Calculate using the most convenient (simplest) way. Which properties of addition will you use?

Example: 18 + 64 + 12 + 6 = (18 + 12) + (64 + 6) = 30 + 70 = 100

22 + 13 + 78 + 17 = _____

3

4

137 + 40 + 113 + 60 =____

236 + 83 + 17 + 44 + 20 = _____

a) Perform the actions in the following order:

- Subtract number 3 from the number 8
- To the result, add the number 4

b) Perform the actions in this order:

- Increase number 3 by 4
- Subtract the result from the number 8

What did you notice?

Lesson 11

Properties of addition. Parentheses.

New Material II

Why do we need parentheses?

When we have a math problem that involves more than one operation—for example, addition and subtraction, or subtraction and multiplication—which operation do you perform first?

Example: 8 - 4 + 1

If the operations are performed in the natural order:

1st - subtraction , then - addition, the answer will be 5.

In order to change the natural order, we use *parentheses*. By inserting parentheses around the particular operation, we are saying that this particular operation should be performed first.

If there are several pairs of parentheses in the expression, we perform operations inside them from the

left to right. (1) (3) (4) (2) Example: (5 + 1) - 4 + (8 - 5)

11 5	Algebra (about 1550).									

Leonhard Euler (1707-1783)

Leonard Euler contributed vastly toward accustoming mathematicians to use parentheses. Euler was one of the most eminent mathematicians of the 18th century and is held to be one of the greatest in history. He is also widely considered to be the most prolific mathematician of all time. He wrote more than 500 books and papers during his lifetime, more than anybody in the field. He spent most of his adult life in St. Petersburg, Russia, and in Berlin, then the capital of Prussia.
