MATH 5: GEOMETRY 2.

Sum of angles of an *n*-gon

Recall that sum of angles of a triangle is 180°. Since a quadrilateral can be cut into 2 triangles, sum of angles of a quadrilateral is $2 \times 180^{\circ} = 360^{\circ}$. Similarly, for a pentagon we get $3 \times 180^{\circ}$, and for an *n*-gon, the sum of angles is $(n-2) \times 180^{\circ}$.

Congruence

In general, two figures are called **congruent** if they have same shape and size. We use symbol \cong for denoting congruent figures: to say that M_1 is congruent to M_2 , we write $M_1 \cong M_2$.

Precise definition of what "same shape and size" means depends on the figure. Most importantly, for triangles it means that the corresponding sides are equal and corresponding angles are equal: $\triangle ABC \cong \triangle A'B'C'$ is the same as:

AB = A'B', BC = B'C', AC = A'C', $\angle A = \angle A', \angle B = \angle B', \angle C = \angle C'.$

Note that for triangles, the notation $\triangle ABC \cong \triangle A'B'C'$ not only tells that these two triangles are congruent, but also shows which vertex of the first triangle corresponds to which vertex of the second one. For example, $\triangle ABC \cong \triangle PQR$ is not the same as $\triangle ABC \cong \triangle QPR$.

Congruence tests for triangles

By definition, to check that two triangles are congruent, we need to check that corresponding angles are equal and corresponding sides are equal; thus, we need to check 6 equalities. However, it turns out that in fact, we can do with fewer checks.

Congruence test 1 (Side-Side-Side rule). If AB = A'B', BC = B'C' and AC = A'C' then $\triangle ABC \cong \triangle A'B'C'$.

This rule is commonly referred to as SSS rule.

One can also try other ways to define a triangle by three pieces of information, such as two sides and an angle between them. We will discuss it next time.

This rule — and congruent triangles in general — are very useful for proving various properties of geometric figures. As an illustration, we prove the following useful result.

Theorem. Let ABCD be a quadrilateral in which opposite sides are equal: AB = CD, AD = BC. Then ABCD is a parallelogram.

Proof. Let us draw diagonal BD. Then triangles $\triangle ABD$ and $\triangle CDB$ are congruent by SSS; thus, two angles the two angles labeled by letter a in the figure are equal; also, two angles labeled by letter b are also equal. Thus, lines BC and AD are parallel (alternate interior angles!). In the same way we can show that lines AB and CD are parallel. Thus, ABCD is a parallelogram.

(It is also true in the opposite direction: in a parallelogram, opposite sides are equal.)

Homework

- **1.** Let CD be a continuation of side AC in a triangle $\triangle ABC$. Show that then $\angle BCD = \angle A + \angle B$ (such an angle is sometimes called an *exterior angle* of the triangle. [Hint: sum of the angles in a triangle is equal to 180° .]
- 2. An *n*-gon is called *regular* if all sides are equal and all angles are also equal.
 - (a) How large is each angle in a regular hexagon (6-gon)?
 - (b) Show that in a regular hexagon, opposite sides are parallel. (This is the reason why this shape is used for nuts and bolts).

[Hint: show that each of the angles labeled by letter a in the figure is equal to 60° , and then use theorem about alternate interior angles.]

- **3.** Let ABC be a triangle in which two sides are equal: AB = BC (such a triangle is called *isosceles*). Let M be the midpoint of the side AC, i.e. AM = MC.
 - (a) Show that triangles $\triangle ABM$ and $\triangle CBM$ are congruent.
 - (b) Show that angles $\angle A$ and $\angle C$ are equal
 - (c) Show that $\angle AMB = 90^{\circ}$ (hint: $\angle AMB = \angle CMB$).

- 4. Let ABCD be a quadrilateral such that AB = BC = CD = AD (such a quadilateral is called rhombus). Let M be the intersection point of AC and BD.
 - (a) Show that $\triangle ABC \cong \triangle ADC$

5. In a group of 100 students, 28 speak Spanish, 30 speak German, 42 speak French; 8 students speak Spanish and German, 10 speak Spanish and French, 5 speak German and French and 3 students speak all 3 languages. How many students do not speak any one of the three languages? [Note: when it says that 28 students speak Spanish, this includes the 8 who speak Spanish andGerman; similarly for all other combinations.]
