

# States of Matter

- Matter can exist in several different *forms*, or *states of aggregation*.

- Matter commonly exists in four fundamental states:

- Solid
- Liquid
- Gas
- Plasma

- The different states of matter are based upon distance between particles (atoms and/or molecules), particle arrangement, and energy of particles.

# SOLIDS

- Particles of solids are **tightly packed**.
- The forces between particles are strong: the particles cannot move freely but can only vibrate about a fixed position.
- Solids have a stable, **definite shape** and a **definite volume**.
- Solids can only change their shape *by force*, as when broken or cut.

# LIQUIDS

- Particles of liquids are **tightly packed** but are **far enough apart** to slide over one another (*mobile structure*).
- The **shape** of a liquid is **not definite** but is determined by its container.
- Liquids are known to be *nearly incompressible*. At constant temperature and pressure, liquids have a **definite volume**.
- The volume of liquid is usually greater than the volume of the corresponding solid (the best-known *exception* being *water*).

# Brownian motion

Robert Brown, 1827

- In 1827, while looking through a microscope at particles found in pollen grains in water, **Brown noted that the particles moved through the water** but was not able to determine the mechanisms that caused this motion.

- Albert Einstein, 1905: Any minute particle suspended in a liquid (or gas) moves chaotically under the **action of collisions** with **surrounding molecules**. The intensity of this chaotic motion is increased with an increase in temperature.
- This explanation of Brownian motion served as **definitive confirmation** that **atoms and molecules actually exist**.

# GAS

- Particles of a gas are very far apart and move freely.
- A gas has an **indefinite shape** and an **indefinite volume**: it will expand to *fill the entire container* in which it is confined.
  - A gas is *compressible*.

# A Comparison: The Three States of Matter

Solid

Liquid

Gas

**Example:** ICE → WATER → WATER VAPOR

# A Comparison: The Three States of Matter

**Solid**

**Liquid**

**Gas**

**Example:** ICE  $\longrightarrow$  WATER  $\longrightarrow$  WATER VAPOR

# What is Temperature?

- **Particles of matter are in constant motion** (*vibrating in place in solids, sliding past each other in liquids, flying around freely in gases*), but they don't all move at the same speed and in the same direction all the time.
- **Temperature is a measure of the average energy associated with random motion of the particles** of a substance.
- The *higher* the temperature of an object, the *faster* on average its particles move.

Flame:  
1000-1500°C
